## **REXX** EXTENSIONS FOR OS/2

CHARLES DANEY Quercus

	Functions for compound variable and array handling
REXX Symposium May, 1993 Charles Daney Quercus Systems P. O. Box 2157 Saratoga, CA 95070 (408) 867-7399 Fax: (408) 867-7489 BBS: (408) 867-7488 CompuServe: 75300,2450 Internet: 75300.2450@compuserve.com	<ul> <li>Array handling <ul> <li>copying from one array to another (overlay)</li> <li>copying from one array to another (insert)</li> <li>deleting portions of an array</li> <li>sorting portions of an array</li> </ul> </li> <li>Compound variable handling <ul> <li>copy all elements</li> <li>save all elements to disk</li> <li>restore all elements from disk</li> <li>find all tails (with optional pattern match)</li> <li>find all values (with pattern match)</li> </ul> </li> <li>Groups of variables <ul> <li>write group to disk</li> <li>read group from disk</li> <li>dump group for debugging</li> </ul> </li> </ul>
<ul> <li>Motivation</li> <li>Make handling of various kinds of aggregates easier <ul> <li>lists</li> <li>sets</li> <li>collections</li> <li>ordered pairs</li> <li>ordered triples</li> </ul> </li> <li>Allow easier simulation of data structures</li> <li>Treat compound variables or groups of variables as a "database" <ul> <li>defaults &amp; user program configuration</li> <li>representation of program state</li> <li>externalize setup of data tables</li> <li>"true" databases (e. g. user directory)</li> </ul> </li> <li>Facilitate exchange of data between programs</li> <li>Faster loading of data</li> </ul>	<ul> <li>"Quasistem"</li> <li>REXX language says that stems contain only final period</li> <li>REXX users use compound names hierarchically pet.katie.rabbit = 'Flopsy' pet.katie.cat = 'Fluffy' pet.katie.dog = 'Fido'</li> <li>Users expect "drop pet.katie." to behave like a stem (without affecting pet.lisa, pet.susy, etc.)</li> <li>Similarly for other operations like copy, read, write</li> <li>When used carefully, this seems useful and internally consistent</li> </ul>

Conventions of library functions	Array conventions
<ul> <li>Quasistems allowed in context where stem is expected</li> <li>Final period is assumed in a stem context</li> <li>Substitution is not performed on quasistem components</li> <li>Case is significant in all but first component of quasistem</li> </ul>	<ul> <li>Common convention is that arrays are integrally subscripted</li> <li>First array element is 1</li> <li>Zeroth element is number of array elements</li> <li>The array stem may be a quasistem</li> </ul>
$\scriptstyle$	Compound variable operations
<ul> <li>Copy - ARRAYCOPY <ul> <li>from-position, to-position, count are options</li> <li>elements of target array are overlaid</li> </ul> </li> <li>Insert - ARRAYINSERT <ul> <li>from-position, to-position, count are options</li> <li>elements of target after insertion point move</li> </ul> </li> <li>Delete - ARRAYDELETE <ul> <li>from-position, count are options</li> <li>remaining elements shift position to eliminate gap</li> </ul> </li> <li>Sort - ARRAYSORT <ul> <li>from-position, count are options</li> <li>start, length, order, type specified for each field</li> </ul> </li> </ul>	<ul> <li>Copy - CVCOPY <ul> <li>Makes exact copy of a compound variable with different stem</li> <li>Target is dropped first</li> </ul> </li> <li>Write to file - CVWRITE <ul> <li>Existing file is erased</li> <li>File contains tails only, not "stem"</li> </ul> </li> <li>Read from file - CVREAD <ul> <li>Target is dropped first</li> <li>File contains talls only, not "stem"</li> </ul> </li> <li>List compound variable tails - CVTAILS <ul> <li>Creates an array with all tails</li> <li>Enables iteration on all tails</li> <li>Regular expression pattern match is optional</li> <li>Case sensitivity is optional in pattern match</li> <li>Search compound variable values - CVSEARCH</li> <li>Creates an array with tails of matches</li> <li>Matching by regular expression</li> <li>Case sensitivity is optional</li> </ul> </li> </ul>
1. 1. 1. 1. 1. 1. 1. 1. 1. 1. 1. 1. 1. 1	

Regular expressions	Regular expression examples
<ul> <li>\ - escapes special characters</li> <li>^ - matches beginning of string</li> <li>\$ - matches end of string</li> <li> matches anything but newline</li> <li>:a - matches alphabetic character</li> <li>:d - matches digits 0 - 9</li> <li>:n - matches alphabetics &amp; digits</li> <li>* - matches 0 or more of expression</li> <li>+ - matches 1 or more of expression</li> <li>? - matches exactly 0 or 1 or expression</li> <li>[] - list of matching characters</li> </ul>	<ul> <li>fido - matches string "fido" anywhere</li> <li>^fido\$ - matches only "fido" by itself</li> <li>[01234567] - matches only valid octal characters</li> <li>[01234567]* - matches string of valid octal characters</li> <li>[^ABC] - matches anything but A, B, C</li> </ul>
జు Variable group operations	
<ul> <li>Write to file - VARWRITE <ul> <li>Existing file is appended</li> <li>All variables in program may be written</li> <li>Optional list of variables &amp; stems to include or exclude</li> <li>Stems are kept in the file</li> </ul> </li> <li>Read from file - VARREAD <ul> <li>Existing stems aren't dropped - data is merged</li> <li>All variables in file may be read</li> <li>Optional list of variables &amp; stems to include or exclude</li> </ul> </li> <li>Dump variables - VARDUMP <ul> <li>Like VARWRITE except output is formatted for visual inspection</li> </ul> </li> </ul>
